Smart actuator module for legged robots

AI MOTOR-1001 MANUAL

Ver 1.02

Thank you for your purchasing our product. This manual shows how to use AI MOTOR-1001 neatly. Before using your AI MOTOR-1001, please read this manual carefully.

1. INTRODUCTION

1.1. Summary

Al MOTOR-1001 is a actuator module for legged robots that can assemble and control various types of robots. Motors are essential for all the moving devices. However, it is not available for general people since special devices and a lot of money are required in control, electronic circuit, and connection and combination of parts. Al MOTOR-1001 integrates motors, members and control circuits in one module so as to easily connect them to one another. Accordingly, if you use the product, you can design joints of a moving device simply and it is easy to expand the device additionally and to cope with troubles of the device. It is possible to connect motors to each other serially so as to simplify wiring. Control commands can be delivered once through a widely used RS-232 serial communication. Operation of motors can be monitored since Al MOTOR-1001 has a function of outputting the amount of the current flowing in the motor and position of the motor.

The operation modes are 360 degrees rotation mode, 0 to 332 degrees range position control mode, act down mode in which position change of the shaft of the motor can be monitored using external force by making torque of the shaft of the motor be zero, power down mode in which power consumption is minimized, synchronous position control mode.

The internal parameters of the motor can be changed by a program through serial communication. The changeable parameters are ID of the motor, baud-rate of the serial communication, position control resolution, position control gain, threshold of over-current, upper bound, lower bound. Al MOTOR-1001 internally confirms external power and controls internal control gain automatically so that constant control response is ensured though input voltage varies. It protects the motor against being damaged by cut off the motor current automatically when the current flowing in the motor is too much, where the threshold of over-current can be changed.

11 types of connecting parts are provided so as to assemble parts in various directions when connecting motors to each other. And also, since there are two shafts of the motor, it is very convenient to connect joints.

1.2. Package Contents

- 1 AI MOTOR
- ② Cable 100mm Cable 150mm
- 3 Joint parts (11 pieces)
- 4 Bolt M1.7 × 8 mm
 Bolts M2.0 × 12 mm (2 pieces)
 Bolts M2.0 × 16 mm (2 pieces)
 Nuts M2.0 (4 pieces)

Joint parts

Table 1. Usage of Joints

Usage	Joint part number
Shaft ↔ Body connection	1, 3, 6
Shaft ↔ Shaft connection	2, 10
Body ↔ Body connection	4, 8
Miscellaneous connection	5, 7, 9, 11

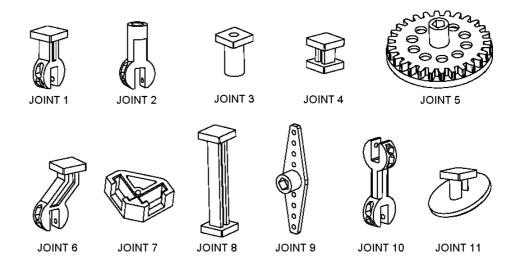

Figure 3. 11 types of Joints

Cable

Cable to connect motors to each other or connect a motor to a control board. Length are 10 cm, 15 cm respectively.

Figure 4. Cable

1.4. Functions

Position control function

Low resolution mode (0 to 332 degrees), High resolution mode (0 to 166 degrees)

Sensor function

Feedback of Current (8 bit) and Position (8 bit)

Speed control function

Position send mode 5 steps, 360 degrees rotation mode 16 steps

Resolution adjustment function (2 steps)

Low resolution 1.3 degrees, High resolution 0.65 degree

360 degrees rotation function (wheel operation mode)

Synchronous position control function

Position control of Al MOTORs start at the same time

Bound setting function

Position range of the shaft

Reverse voltage protection

0 to -28 V

Over-current protection

Settable range 400 to 1000 mA

Parameter setting function

ID, Baud-rate, resolution, threshold of over-current, P-gain, D-gain

Voltage sensing function

Internal control gain is set automatically depending on Input voltage (DC 5 to 10 V) $\,$

Mechanical direct connection between modules

Various connections are possible using 2 output shafts, body joint part and 11 types of joint parts.

Electrical direct connection between modules

Electrical direct connection are possible using two connector terminals and a connector cable.

Control signal I/O by communication

A full-duplex UART is built-in. The motors are controlled in RS-232 serial communication, 31 motors can be connected and controlled in one channel

1.5. Features and specifications

Advantages

- High performance to price
- Excellent assembly between motors
- Good gear endurance
- Various operation modes supplied
- Test tool program supplied
- Various application program supplied

Size

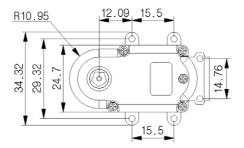

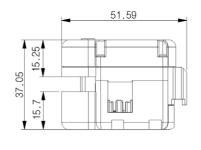

Figure 5. Size of Body

unit: mm

Specifications

Table 2. Specifications of Al MOTOR-1001

Communication		Standards	RS-232 asynchronous serial communication (TTL level)				
	Capabil	ity of Connection	Maximum 31 per one communication channel				
		ID	0 to 30				
		Baud-rate	2400 to 460800 bps				
Parameter	ı	Resolution	Low Resolution (1.3 degrees) or High Resolution (0.65 degree)				
Range		P-Gain	Recommended 1 to 50				
		D-Gain	Recommended 0 to 100				
	Thresho	ld of Over-current	Approximate 400 mA to 1000 mA				
	Lower bo	und, Upper bound	0 <= Lower bound < Upper bound <= 254				
	Max	imum Torque	Approximate 10 Kg·cm (at +9.5 V)				
Operation	Мах	dimum Speed	Approximate 60 rpm (at +9.5 V)				
Operation	Mir	nimum Angle	Low resolution mode : 333.3/255 ≒ 1.307 degree High resolution mode : 166.65/255 ≒ 0.654 degree				
Operation Mode	Position Send Mode	Speed Mode 0 (Fastest) Speed Mode 1 Speed Mode 2 Speed Mode 3 Speed Mode 4 (Slowest)	The present current and position are informed of and it moves to a specific position				
	Position Read Mode		The present current and position are informed of.				
		Down Mode n Sensor Mode)	The present current and position are informed of, torque of the motor is removed, and the motor is moved by the external force.				
	Powe	er Down Mode	Power down state is maintained without torque of the motor until another command is received.				
	360 d	egrees Rotation Mode	16 steps speed control(0: stop, 1: min, 15: max)				
	, ,	ronous Position ontrol Mode	Position control of Al MOTORs start at the same time				
System	Limitatio	n of Over-current	Approximate 400 to 1000 mA (settable by user)				
Protection	Inverse '	Voltage Protection	0 to -28 V				
	Motor	Types	DC precious metal brush motor				
	IVIOLOI	Maximum Current	650 mA at DC 5V, 1000 mA at DC 10 V				
Electrical		Input Voltage Level	High(2.57 to 5.2V), Low(-0.5 to 0.94V)				
	Control Circuit	Output Voltage Level	High(3.25 to 4.7V), Low(0 to 0.6V)				
		Current	11.7 mA in general mode, 11.6 mA in power down mode				
		necting Parts	11 types (Plastic)				
		Size(Max.)	51.6 × 34.3 × 37.1 mm				
Mochanical	Mutual	Weight	46 g				
Mechanical		Connecting Points Gear Ratio	3 places 1 : 241				
		ear Material	Metal, Plastic				
		Bearing	Metal

2. Detailed Description and Usage

2.1. Hardware interface

Power supply and signal line used in a connector that is hardware interface of Al MOTOR will be described from now on.

Connector

Al MOTOR body has two connectors. Two connectors are connected to each other in parallel internally. You can use Al MOTOR if you connect any one of the two connectors. The other connector is used to connect another module in serial.

1: Ground, 2: RXD of Al MOTOR, 3: TXD of Al MOTOR, 4: Vcc Figure 7. Connector

Electrical characteristics

Ts	Storage Temperature	-40	80	$^{\circ}$

Power On Reset

No commands are received for 65 ms after turned on. After that, operating in act down mode.

Figure 8. Sequence of Power On Reset

RS-232 signal timing

Control commands and data are transmitted and received in asynchronous RS-232 communication of TTL level. At over 115200 bps, it need delay time over 150 us within the stop bit of a byte and the start bit of the next byte. At under 57600 bps, it need no delay time.

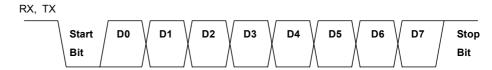

Figure 9. Signal Timing of RS-232 communication

RS-232 communication delay

Since AI MOTOR-1001 receives commands in RS-232 communication, all the motors do not receive commands at the same time in the case that a few modules are connected and the motors are controlled. Although communication delay is usually negligible, consider communication delay time shown in the following table and use AI MOTOR-1001.

Table 5. Delay Time of Communication

Baud-rate [bps]	1 byte transmission time [ms]	1 command (4 bytes) transmission time [ms]	1 command delay angle [Deg.] at 30 rpm
2400	4.167	16.667	3
4800	2.083	8.333	1.5

Position control response

Since control gain is set automatically owing to automatical voltage sensing function, it does not over-shoot though input voltage is raised up.

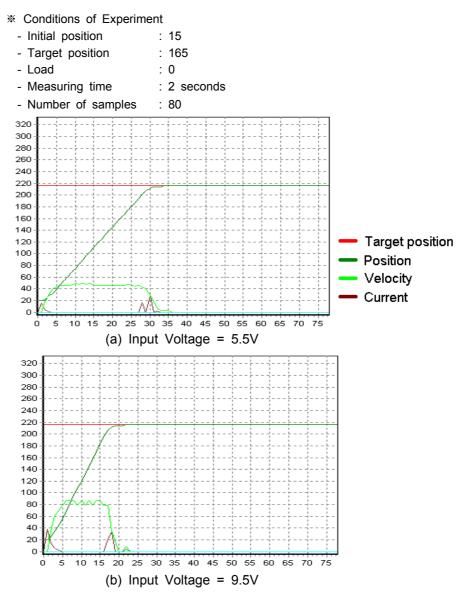

Figure 10. Response of Position Send Command

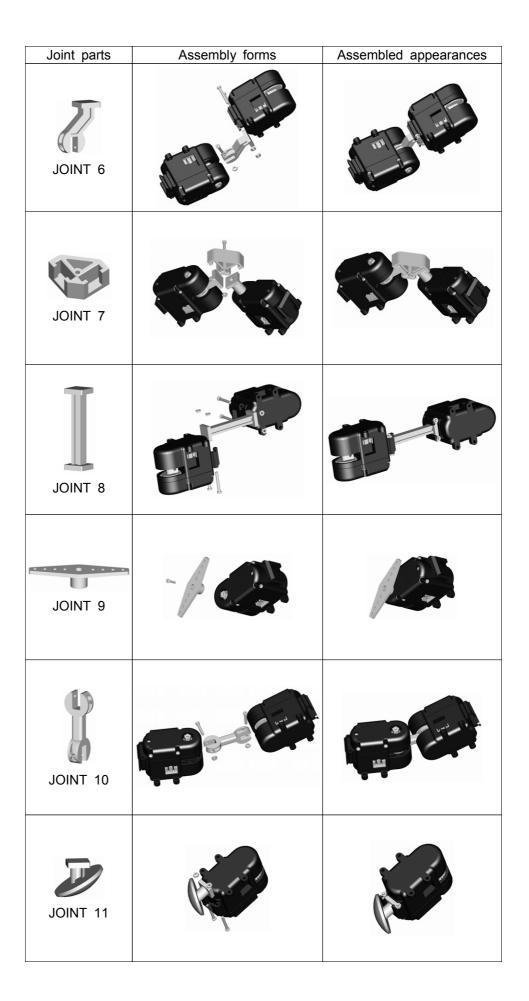

2.2. Mechanical interface

The usage of a body joint part, an output shaft and a joint part which are mechanical parts of AI MOTOR will be taught.

Types and examples of joint parts

Table 6. Usage of Joints

Joint parts	Assembly forms	Assembled appearances
JOINT 1		
JOINT 2		
JOINT 3		
JOINT 4		
JOINT 5		

2.3. Software interface

Communication protocol that is software interface of Al MOTOR will be described.

2.3.1. Communication flow

All the communication commands flow as illustrated in the following figure. When a controller sends a command packet to Al MOTOR, Al MOTOR returns a response packet to the controller.

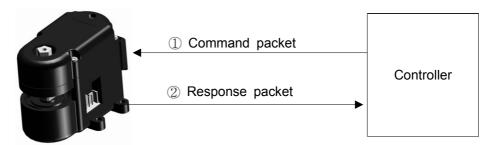

Figure 11. Flow of Communication

2.3.2. Command Packet

There are two kinds of command packets, that is, an operation command packet and a setting command packet (6 bytes).

2.3.2.1. Operation Command Packet

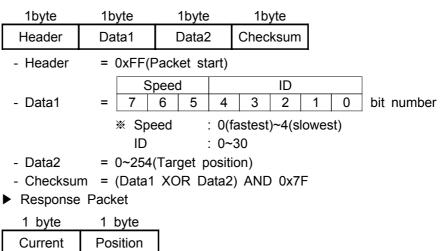

Position Send Command

Command to return to the other controller the present current of AI MOTOR and the present position of output shaft, and move to a desired location. The speed can be controlled in 5 levels.

▶ Command Packet

- Current

- Position

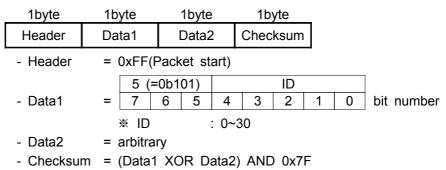

= 0~255

= approximate 18.4 mA per 1

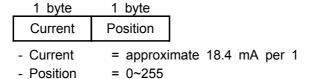

Position Read Command

Command to return the present current of AI MOTOR and the present position of output shaft

▶ Command Packet

▶ Response Packet

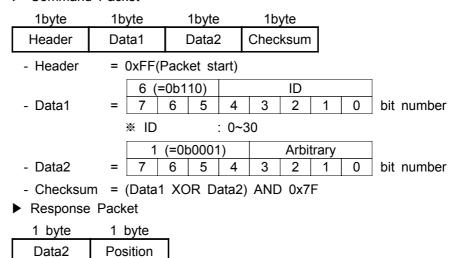

Act Down Command

- Position

Command to send the present position of output shaft and remove torque of the motor to move due to external force.

▶ Command Packet

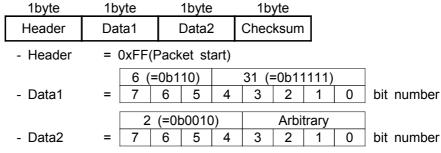

= 0~255

Power Down Command

All the connected Al MOTORs are powered down. If a communication command is received, AI MOTORs are awakened.

Command to send the present position of output shaft and remove torque of the motor to move due to external force.

▶ Command Packet

- Checksum = (Data1 XOR Data2) AND 0x7F

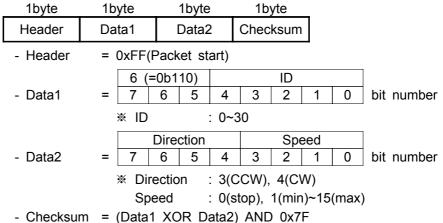

▶ Response Packet

1 byte	1 byte
ID	Position

360 degrees Rotation Command

Command to rotate the shaft of AI MOTOR by 360 degrees. Its speed can be controlled in 16 levels.

▶ Command Packet

▶ Response Packet

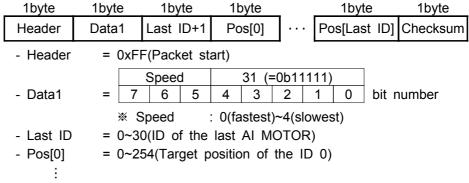

- Rotations = 0~255(rotations after power-on, ⊕ : CCW, ⊡ : CW)

- Position = 0~255

Synchronous Position Send Command

Command to control several Al MOTORs at the same time. The speed can be controlled in 5 levels.

► Command Packet

- Pos[Last ID]= 0~254(Target position of the Last ID)
- Checksum = (Pos[0] XOR Pos[1] ··· XOR Pos[Last ID]) AND 0x7F
- ▶ Response Packet
 - none

2.3.2.2. Setting command packet (6 bytes)

Baud-rate Set Command

Command to set the Baud-rate of Al MOTOR. Supplied Baud-rate is 2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400, 307200 and 460800 bps.

2.4. Position Control Function

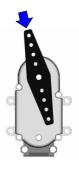

When a user send his or her desired absolute position in the range of 0 to 254, the shaft of Al MOTOR is moved to the desired position. The position control function is executed by the 'Position Send Command'. Here, notice that the absolute position depends on the resolution.

Low Resolution Mode

Position control range is 0 to 332 degrees. Unit angle is about 1.307 degrees.

Position 0

Position 128

Position 254

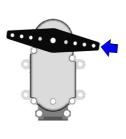

Figure 12. Position in Low Resolution Mode

 \divideontimes Note: When Joint 1 or 2 or 10 be combined, it can be move in $66 \sim 207$.

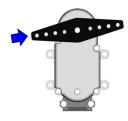

When Joint 6 was combined, it can be move in 43 \sim 186 or 86 \sim 229.

High Resolution Mode

Position control range is 0 to 166 degrees. Unit angle is about 0.654 degree.

Figure 19. A Pan-tilt structure using 2 Al-motors

3.4. Example of program(1)

This is an example of program in pseudo C code. Because The function of serial communication depends on the CPU, you should modify the serial functions.

```
/*----*/
/* AI MOTOR example code
/* description : If you move the shaft, the shaft rotate the same direction
                                                                 */
             and stop.
/\star principal : Using position feed back function of AI MOTOR, the program
                                                                 */
    detect the variation of position and direction
#define HEADER

/* description : Synchronous position send command function example
                                                                      */
/* principal : Using synchronous position send function of AI MOTOR, control
            several modules at the same time
                                                                      */
/*=======*/
                     -refer to example of program(1)-
void main(void)
      // Motion table for ID 0~4 AI-motor(3 frames)
      char table[5*3] = \{ 10, 0, 20, 100, 20, 
                          125, 30, 0, 50, 150,
                           55,120,200, 88, 5};
      Initialize(); // peripheral initialization
      // synchronous position control ID 0~4 AI-motors at speed 0(fastest)
      SyncPosSend(4, 0, table, 1);
      delay_ms(1000); // delay 1 second
      // synchronous position control ID 0~2 AI-motors at speed 1(fast)
      SyncPosSend(2, 1, table, 0);
      delay_ms(1000); // delay 1 second
      // synchronous position control ID 0~1~{\rm AI-motors} at speed 3(slow)
     SyncPosSend(1, 3, table, 2);
delay_ms(1000); // delay 1 second
}
```
